Printed Circuit Boards (PCBs) are used to hold and connect electronic components and are found inside every electronic device. They are assembled in an automated process, where they are exposed to extreme heat and chemicals. During assembly, traceability of the PCB is vital – and this requires the use of identification and tracking labels.

Avery Dennison’s polyimide label constructions are specially designed to ensure reliable PCB tracking during manufacturing. They maintain their physical integrity, and excellent heat-resistant topcoats ensure that tags remain legible when exposed to extreme temperatures and chemicals.

Finding a good match between label performance and application is crucial for minimizing costs, and Avery Dennison offers a complete product range that allows you to make the right choice for specific requirements.

Identification and tracking labels are integral parts of the PCBs used in computers, telecommunications equipment, consumer electronic goods, industrial equipment, medical instruments, automotive systems, military systems and aerospace engineering.
PCB labels are engineered to withstand heat and aggressive chemicals

The Avery Dennison portfolio of polyimide labelling materials delivers value and flexibility throughout the PCB supply chain.

- Our new economy Polyimide products with the topcoats TC13 and TC14 perform exceptionally well at the very high temperatures used in today’s lead-free soldering (up to +260°C, continuously for 5 minutes). After soldering and PCB cleaning with common aggressive cleaning agents, these printed labels remain clearly readable.

- Our well-established Polyimide I&II Matt White grades suit the most demanding PCB labelling applications where labels are exposed to extreme peak temperatures of up to +280°C. These grades offer superior resistance to highly corrosive solvents, and also allow for high resolution, fine feature print.

Maximum temperatures specified for many PCB soldering processes are between +240°C and +260°C, and peak temperatures of up to 280°C are not uncommon.

Process temperatures are end-product and end-application specific, and the Avery Dennison polyimide portfolio fully addresses the entire range of PCB labelling requirements.
Avery Dennison polyimide facestocks and topcoats are engineered components, matched to deliver high performance in demanding applications. All polyimide label materials are optimized for thermal transfer printing, and printed labels offer good resistance against the harsh chemicals used in the production and cleaning of PCBs.

- **Polyimide I GL WH TC13** - based on a 25μm polyimide with a thick glossy topcoat. The total caliper of the facestock is 40μm. This material can be printed with a variety of thermal transfer ribbons and features good chemical resistance. To achieve a good print performance, an increased temperature setting for the thermal transfer printer may be required.

- **Polyimide I WH TC14** - based on a 25μm polyimide with a thick semi-matt white topcoat. The total caliper of the facestock is 46μm. This material can be printed with a variety of thermal transfer ribbons and features good chemical resistance. To achieve a good print performance, an increased temperature setting for the thermal transfer printer may be required.

- **Polyimide II WH TC14** - based on a 50μm polyimide with a thick semi-matt white topcoat. The total caliper of the facestock is 71μm. This material can be printed with a variety of thermal transfer ribbons and features good chemical resistance. To achieve a good print performance, an increased temperature setting for the thermal transfer printer may be required.

The following materials are optimized for thermal transfer printing of high density barcodes with superior chemical and scratch resistance.

- **Polyimide I Matt White** - based on a 25μm polyimide with a premium thick matt white topcoat. The total caliper of the facestock is 43μm.
- **Polyimide II Matt White** - based on a 50μm polyimide with a premium thick matt white topcoat. With the high caliper of this facestock (68μm) automatic dispensing of labels is improved.

S8088 adhesive is a solvent acrylic adhesive specially formulated to withstand extremely high temperatures, corrosive solvents and high UV radiation.

These products are stocked in Europe and are available with small minimum order quantities. See table for more details on service options.
