Creating True Sustainability

Strong, lightweight, transparent and highly versatile, polyethylene terephthalate (PET) plastic is the ideal material for consumer packaging. Yet one of the traits that makes PET equally valuable to brand owners is its tremendous potential for recyclability. Creating a sustainable application solution requires brands, packaging designers and manufacturers to produce PET packaging that works in harmony with the recycling stream, especially the sink/float washing process. The Association of Plastic Recyclers (APR) suggests choosing packaging materials that conform with its APR Design™ Guide for Plastics Recyclability, including labels that float in water, inks that don’t bleed and adhesives that don’t disperse on the PET regrind.

Up to 100 percent of a PET container can be made using recycled PET (rPET), with no limit to the number of times PET material can be reused in container applications.

Reduce Waste with CleanFlake™ Technology

Now, converters are able to offer brand owners a new way to differentiate their products and enhance sustainability. Avery Dennison CleanFlake™ Portfolio of labeling solutions significantly improve the rPET yield in the recycling process while maintaining the shelf appeal that pressure-sensitive labels are known for. Pressure-sensitive labels typically limit PET recyclability into food-grade rPET due to adhesive contamination. However, CleanFlake™ technology cleanly separates in reaction to the caustic bath, leaving no adhesive residue on the PET flake.

*Passes APR Critical Guidance Recognition  **Passes APR Benchmark Test, the highest form of testing available for paper

For more information about how to deliver improved sustainability with outstanding shelf impact, go to label.averydennison.com/cleanflake

**Key Features**
Enhance PET bottle and thermoform container recycling, increasing rPET supply
- The caustic wash breaks the cohesive bond allowing the label to separate cleanly
- No adhesive residue remains on the PET flake, meaning no contamination
- Plug & Play solution - compatible with existing value chain
- Passes the highest form of testing available from the APR*, including Critical
- Guidance Recognition for films

**Conversion Information**
In addition to the choice of substrate, APR guidelines can be impacted by the application method, printing process, graphics and the label converting process. It is recommended to test ink systems for suitability with the APR guidelines without negatively impacting the converting and finished label quality. To ensure clean separation between the label and the PET flake, the final (print+label+adhesive) layer must have a total density of less than 1.0.
